

"Spiral Staircase"

- Let me preface this model by saying "IM SORRY". There is seemingly no easy way to construct a spiral staircase although I have done my best. As painful as this model may be to construct, in the end it is well worth your time and an essential part of any castle or keep.
- Cut fold and score where noted. Use the above photos as a general folding guide.
- Start by sandwich gluing the door section.
- Now glue the top left glue tab on the first step to the top of the main staircase. (the piece with the door attached). Allow a minute to dry before proceeding.
- Continue working your way down step by step until you have attached one full side.
- Take the inner wall and glue its vertical tab just below the door. Allow at least one minute to dry.
- As you did with the other side start by gluing the top tab in place and allow some dry time before moving to the next step.
- Continue gluing the remaining steps in place and you're all done!
